Body: Obstructive sleep apnoea is associated with disturbances in glucose metabolism and increased risk of type 2 diabetes. The aim of this study was to assess relations between OSA and diabetes. We studied 1164 OSA pts ( 876 males and 298 females), mean age $=56.4 \pm 10.4$ years, $\mathrm{AHI}=39.6 \pm 21.7, \mathrm{BMI}=$ $34.2 \pm 6.4$, mean $\mathrm{SaO}_{2}=90.8 \pm 5.8 \%$. Diabetes was found in 249 pts (21.4\%). Comparison of OSA groups with- and without diabetes is shown in the table.

| Variable | OSA (n=915) | OSA \& Diabetes (n=249) | p |
| :--- | :--- | :--- | :--- |
| Age (years) | $55.7 \pm 10.8$ | $58.7 \pm 8.4$ | $\mathrm{p}=0.001$ |
| AHI (n/h) | $38.6 \pm 21.4$ | $43.6 \pm 22.4$ | $\mathrm{p}=0.009$ |
| Mean SaO2 (\%) | $91.3 \pm 4.6$ | $89.3 \pm 8.3$ | $\mathrm{p}=0.0002$ |
| BMI (kg/m2) | $33.4 \pm 6.2$ | $37.2 \pm 6.3$ | $\mathrm{p}<0.0001$ |
| Epworth score (points) | $11.2 \pm 5.7$ | $11.7 \pm 6$ | NS |
| Coronary artery disease (n/\% of pts) | $174(19 \%)$ | $88(35.3 \%)$ | $\mathrm{p}<0.001$ |
| Heart failure (n/\% of pts) | $77(8.4 \%)$ | $54(21.7 \%)$ | $\mathrm{p}<0.0001$ |
| Arterial hypertension (n/\% of pts) | $633(69.2 \%)$ | $224(90 \%)$ | $\mathrm{p}<0.0001$ |
| Atrial Fibrillation (n/\% of pts) | $75(8.2 \%)$ | $21(8.4 \%)$ | NS |
| Stroke (n/\% of pts) | $26(2.8 \%)$ | $18(7.2 \%)$ | $\mathrm{p}=0.001$ |

Logistic regression analysis revealed significant correlations between diabetes and cardiovascular diseases and obesity ( $\mathrm{BMI}>30 \mathrm{vs} \leq 30 \mathrm{~kg} / \mathrm{m} 2$ ).

| Risk of <br> Diabetes | Arterial <br> Hypertension | $\mathrm{BMI}>30 \mathrm{~kg} / \mathrm{m} 2$ | Heart Failure | Coronary artery <br> disease | Stroke |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{OR}(95 \% \mathrm{Cl})$ * | $2.96(1.86-4.69)$ | 2.28 <br> $(1.46-3.57)$ | 1.8 <br> $(1.14-2.82)$ | $1.64(1.15-2.34)$ | 2.33 <br> $(1.17-4.63)$ |
| p | $\mathrm{p}<0.0001$ | $\mathrm{p}=0.003$ | $\mathrm{p}=0.01$ | $\mathrm{p}=0.005$ | $\mathrm{p}=0.01$ |

*- Adjusted for AHI (>30 vs $\leq 30$ ), COPD, atrial fibrillation, hyperuricaemia, T90 (>30 vs $\leq 30 \%$ )

Conclusions: Diabetes was frequent (>20\% of subjects) in moderate and severe OSA patients. Cardiovascular diseases and obesity were the independent predictors of diabetes in this group.
